

High Temperature, Micropower Unipolar/Omnipolar Switch

Datasheet (EN) 1.0

Product Overview

The NSM107x series of hall sensors are designed for consumer and industrial applications, which moisture sensitivity level (MSL) are one. They are based on planar hall effect technology and offered in multiple magnetic thresholds, output interfaces, and packages to accommodate various applications.

The micropower version has very low power consumption, which is ideal for battery operated products where minimal current consumption is required.

The general version has milliampere-level power consumption. Its maximum switching frequency is 30kHz.

Typical Applications

- Position, proximity contactless switch in battery powered consumer, home appliances and industrial applications.
- Smart meters
- IOT devices
- Medical devices
- Robot vacuum cleaner

Packages

STD: SOT23-3L

TO: TO-92s

Key Features

- 40°C to +125°C operating temperature
- Industrial level
- 1.65 V to 5.5 V operating Vcc range
- Micropower operation version available:
20 Hz sampling rate, 1.5 μ A average current consumption
- General operation version available:
2 mA current consumption
- Magnetic threshold options (typ.): 1.9 mT, 3.6 mT
- Omnipolar/unipolar switch
- Output interface options: open drain, push-pull
- Package options: SOT23-3L, TO-92s

8. Function Description

8.1. Overview

NSM107X integrates rotating current Hall plate, Schmitt trigger , open drain & push-pull output, which can convert the changing external magnetic field signal into a digital voltage signal to achieve position detection.

When the applied magnetic flux density (B) perpendicular to the package exceeds the operating point (Bop) the output is switched on (pulled low). The output will be turned off when B is lower than the releasing point (Brp). Omnipolar (North and South pole) and unipolar (South or North pole) magnetic responses are available.

The NSM107X is available in two packages: STD is a general-purpose 3-pin SOT-23 package, and TO is a general-purpose TO-92s plug-in package. Both packages are lead (Pb) free and RoHS compliant with 100% tin plated lead frame.

8.2. Function Description

The output state of NSM107X changes when a magnetic field perpendicular to the Hall-effect sensor exceeds the operate point threshold (Bop). When the magnetic field is reduced below the release point (Brp), the device output changes to the alternate state. For unipolar an increasing south field is required; In omnipolar mode, the device will switch on and off with either magnetic polarity.

Figure 8.1 Magnetic Options shows the output switching behavior relative to increasing and decreasing magnetic field. On the horizontal axis, the B+ direction indicates increasing south polarity magnetic field strength.

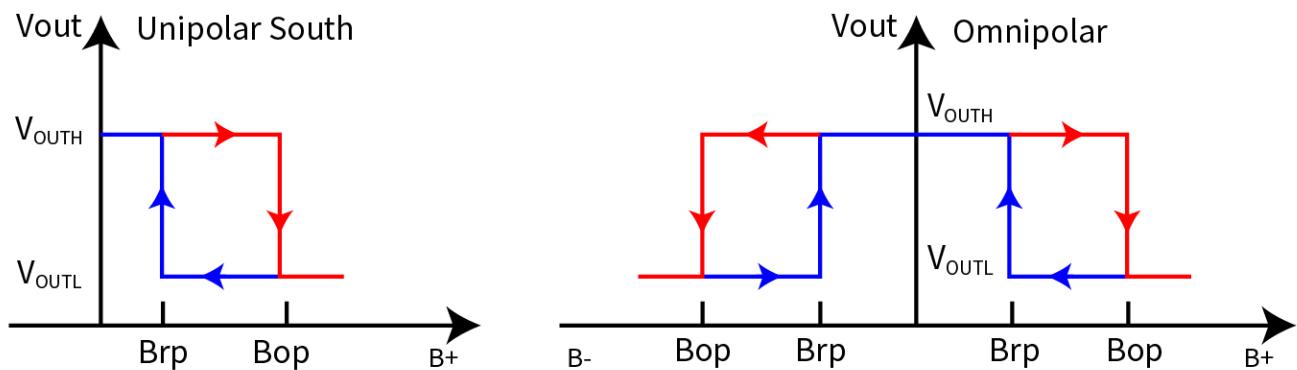

Figure 8.1 Magnetic Options

9. Application Note

Typical Application Circuit

It is strongly recommended that an external bypass capacitor be connected between the supply and ground of the device to guarantee correct performance under harsh environmental conditions and to reduce noise from internal circuitry.
